

DICE-Gas Turbine Compound Reheat Combined Cycle

John Gulen

Bechtel Infrastructure & Power, Inc.

The concept uses coal-water slurry/fluid in the DICE and natural gas (or hydrogen) in the gas turbine for unmatched efficiency (well above 50% net LHV) and modularity (block sizes of 120, 240 and 360 MW) with easy adaptability to CCS with minimal additional cost, complexity and performance hit.
