

Experiences and challenges of MATS in the USA

Mick Zulpo, Apex – USA

The USA MATS implementation saw many facilities struggle with mercury monitoring due to site specific challenges. Variables such as process variations, changes in fuel inputs, stack gas composition fluctuations and sampling location limitations have contributed to facilities needing to look for unique solutions as to be able to comply with their Hg emission requirements. As vendors we are often asked to help resolve these issues in unique and innovative ways. This presentation will share some of these experiences and the creative solutions executed to allow these facilities to comply with their reporting obligations.
